

# Package inside VS Code

1. Right click on your Java Project Name (Crack-Java in this case)
2. Then click New Package.
3. Enter name for the Package (EX- com.example or com.example. child1) for creating sub-package inside example
4. Then Enter a class Name.
5. A newly created packake is now visible
6. To use f/n, classes from another package use import statements-
  - Import packgename. subpackage. \*
  - Import packagel.className
  - Using quantified name

Or, you cold also just click + icon to create folder and then insert files for new package
